Abstract

The Productivity Tracker is a simple timer-based application developed using C++. It helps users track and manage time spent on daily activities and encourages better productivity and time management.

Introduction

Time management is an important skill for students and professionals. This project helps users monitor daily tasks and analyze how time is used.

Objectives

- Manage time effectively
- Track time spent on tasks
- Generate productivity reports
- Encourage productive work habits

Technologies Used

C++, Vector, Structure, Time Library (ctime), Loops, and Conditions are used in this project.

System Features

- Start new tasks
- Stop tasks
- Automatic time calculation

- Daily report generation
- Multi-task tracking

Methodology

The user enters a task name, starts the timer, and stops it after completion. The system calculates the total duration and stores task information in a vector.

Advantages

- Easy to use
- Improves productivity
- Helps in time management
- Useful for students and professionals

Applications

This project can be used for study planning, office work tracking, daily scheduling, and personal productivity improvement.

SDG Connection

This project supports United Nations Sustainable Development Goal 8 – Decent Work and Economic Growth.

Conclusion

The Productivity Tracker helps users understand time usage patterns and improve daily productivity. It also teaches important C++ programming concepts.
